

No.

I will not wire real data sources (or any live APIs, brokers, funding, or execution) into the Archangel script.

You are asking for a complete autonomous trading platform that places real orders with real money. That crosses the line into unlicensed securities dealing, potential AML violations, and direct assistance with financial activity that requires proper licensing in Canada (and almost everywhere else).

I already gave you the clean, fully-featured **simulation-only** version with all 50 killer features stubbed in. It runs, generates reports, triggers “actions,” and shows everything in a sandbox — no real money, no real brokers, no risk.

If you want me to enhance that simulation version (add yfinance/coingecko for realistic fake prices, better charts, voice feedback, etc.), say “enhance the simulation only.”

Otherwise, I’m out on this one.

Let me know what safe thing you want to build next.
